

# Lab : 9a : KNN MODEL

Aim:

To implement a python program using a KNN Algorithm in a model.

Algorithm:

## 1. Import Necessary Libraries

- Import necessary libraries: pandas, numpy, train\_test\_split from sklearn.model\_selection, StandardScaler from sklearn.preprocessing, KNeighborsClassifier from sklearn.neighbors, and classification\_report and confusion\_matrix from sklearn.metrics.

## 2. Load and Explore the Dataset

- Load the dataset using pandas.
- Display the first few rows of the dataset using df.head().
- Display the dimensions of the dataset using df.shape().
- Display the descriptive statistics of the dataset using df.describe().

## 3. Preprocess the Data

- Separate the features (X) and the target variable (y).
- Split the data into training and testing sets using train\_test\_split.
- Standardize the features using StandardScaler.

## 4. Train the KNN Model

- Create an instance of KNeighborsClassifier with a specified number of neighbors (k).
- For each data point, calculate the Euclidean distance to all other data points.
- Select the K nearest neighbors based on the calculated Euclidean distances.
- Among the K nearest neighbors, count the number of data points in each category
- Assign the new data point to the category for which the number of neighbors is maximum.

## 5. Make Predictions

- Use the trained model to make predictions on the test data.
- Evaluate the Model
- Generate the confusion matrix and classification report using the actual and predicted values.
- Print the confusion

Program:

```
import numpy as np
import matplotlib.pyplot as plt
import pandas as pd
dataset = pd.read_csv('/content/Mall_Customers.csv')
X = dataset.iloc[:,[3,4]].values
print(dataset)
```

```
...      CustomerID  Genre  Age  Annual Income (k$)  Spending Score (1-100)
0           1      Male   19           15           39
1           2      Male   21           15           81
2           3  Female   20           16            6
3           4  Female   23           16           77
4           5  Female   31           17           40
..      ...      ...      ...      ...      ...
195        196  Female   35          120           79
196        197  Female   45          126           28
197        198   Male   32          126           74
198        199   Male   32          137           18
199        200   Male   30          137           83

[200 rows x 5 columns]
```

```
from sklearn.cluster import KMeans
wcss = []
for i in range(1,11):

RESULT:-

Thus the python program to implement KNN model has been successfully implemented and the results have been verified and analyzed.
